

MAKE A NON-TOXIC MOSQUITO TRAP

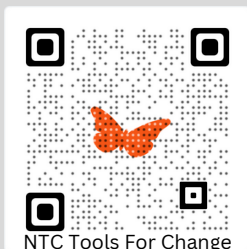

Known as the “bucket of doom” this DIY trap uses an organic approved, highly targeted biological control that kills only the larvae of mosquitos, black flies, and fungus gnats without harming people, pets, wildlife or pollinators.

5 gallon bucket Bti dunks or bits Hydroponic lid

Instructions: Drill a hole near the top of the bucket for rain overflow. Fill with water. Add a handful of leaves, straw, or grass clippings. Add mosquito dunks. Cover with a lid for safety. Mosquitos lay their eggs in the water, and the Bti kills the larvae before they can hatch.
